WELCOME! *Welcome*

Welcome to Enchanted's Wellness and Weight Loss Program.!

We are so glad that you are here! We acknowledge you for taking the first step--investing in yourself.

The knowledge that you will gain is designed to help you become healthier and stay healthy once your program ends. This is not a quick-fix diet. You've probably tried many of those, and you know that they don't work in the long-term. Our goal is to help you develop life style habits such as healthier eating and how to incorporate exercise into your daily life that will help you sustain your weight loss long after your program ends.

We are passionate about helping you look your best on the outside but also about teaching our clients how develop healthier lifestyles to feel better and lead a healthier lifestyle overall. We can help you reach your goal weight and provide with tools and ongoing support to maintain a healthier lifestyle.

- We provide you with a Meal Prep Guide to use during your weight loss program, as well as a Healthy Food Guide and Daily Exercise Guide.
- Weekly during your program you will have a 15 min appointment with a provider at which time they will provide education and coaching.

SET YOUR GOALS

Set Your Goals

SET YOUR GOALS

Set Your Goals

The first step to achieving any goal is getting your goals straight. This gives you an idea of what it takes to achieve your goal and how long it will take to achieve it whilst also being realistic with yourself. Many people get so hung on trying to achieve unrealistic goals

WHAT IS MY GOAL?

Be as specific and as realistic as you can. How much weight would you like to lose? How many sizes would you like to drop?

WHY DO I WANT THIS?

What is your true reason? This is important as it will keep you motivated throughout this journey

BY WHEN WOULD YOU LIKE TO ACHIEVE THIS GOAL?

WHAT ARE MY ROADBLOCKS AND HOW WILL I OVERCOME THEM?

HOW WILL I MARK MY PROGRESS?

Now that you know your end goal, you need to track your progress throughout your journey. Everybody is different and fallbacks are going to happen. It is natural and just use your setbacks to learn from them. Then, you'll be unstoppable.

TAKE YOUR MEASUREMENTS

My current weight is _____

For the measurements, please use anthropometric measuring tape:

What is a A HEALTHY DIET

A healthy diet is a diet that helps you lose weight and promotes good health. While there's no surefire way to lose weight, a healthy diet can make it easier by helping you control calories and feel full longer.

When it comes to health, researchers have found that every illness can be tracked to a vitamin and mineral deficiency. For example, if your thyroid gland is becoming underactive, it may be due to iodine, zinc or copper deficiency. If you're struggling with chronic tiredness and fatigue, it could be due to lack of B vitamins or iron. Even cancer and cancerous cells can be controlled with nutrition. Plenty of research has shown the keto diet (low-carb and high-fat diet) to be an incredible for limiting the growth of cancer cells [1] [2]. In general, everything that happens to our health seems to be due to the way that we eat. Those who are overweight became overweight due to consuming too many calories over prolonged period of time.

This is where healthy eating comes into play. A healthy diet isn't just about reducing calories but it's also about providing you with all the necessary vitamins and minerals so it functions properly. This not only helps your body keep healthy but it also makes it more efficient at losing fat too. Without healthy diets rich in vitamins and minerals, we are more likely to experience anxiety and depression. In fact, many nutritionists and dietitians have recognized that proper nutrition improves moods—and by extension productivity—in addition to overall well-being and health.

Over the next few pages, you'll learn more about calories and energy balance as well as the components of a healthy diet so you can achieve optimum nutrition that's best for your weight loss journey.

What are CALORIES AND ENERGY BALANCE

Understanding calories and energy balance may be a challenge, but we will make it as simple as possible.

Calories are a unit of measurement for energy. Think of them in a similar way as miles being a unit of measurement for distance or kilograms being a unit of measurement for weight. Calories simply indicate how much energy our body is going to obtain from given food. Since every body is different, we all need different amount of energy too. Some of us need 2,000 calories per day and others need 3,000 calories per day. It all depends on our body composition (muscle mass and fat mass), age, gender, and lifestyle. Those who exercise regularly will need more energy than those who lead more of a sedentary lifestyle. The obvious reason is than those who exercise regularly will be expending more energy than those who don't.

Energy balance, on the other hand, refers to the number of calories than our body needs every day to stay alive and to perform any daily activities that you take part in. When you are consuming a number of calories that equals to the number of calories that you expend every day, that is energy balance. When you're in energy balance, your body will maintain it's current weight. It can still fluctuate due to hormones, bowel movements and stress, but it will roughly stay the same weight.

On the other hand, if you consume more calories than you expend, your body will start to store the extra calories in your body. These calories can be stored in the form of fat or muscle. If you exercise regularly and lift weights, it's likely that those calories will be stored in the body as muscle. However, if you lead a more sedentary lifestyle, your body has no choice but to store these calories as fat. And this is how you start gaining weight.

On the contrary, if you consume fewer calories than you expend then your body will start to scavenge for other sources of energy like your fat stores. It will break down the fat stores into fatty acids which will circulate in your blood and be used for energy. When the fat stores are broken down into fatty acids, the fat cells then begin to shrink which leads to fat loss.

Over the next few pages, you're going to learn more about how to calculate your calories in order to start losing weight and how to divide these calories between three major macronutrients - proteins, carbohydrates (carbs), and fats.

What are... MACRONUTRIENTS

Macronutrients are nutrients that provide energy to your body: carbohydrates, protein and fat. Each macronutrient performs it's own special role within your body and provides it with different amount of calories (energy) and nutrients. For examples, carbs provide nutrients that help your body breakdown and use food for energy. On top of that, they are broken down into simple sugars during digestion, scientifically known as monosaccharides. These sugars, once available for the body, are the first thing your body grabs when it needs energy. That's why carbs are the body's primary sources of energy.

Protein is important for building and repairing muscle tissue. In fact, up to 30% of your body's protein is used for cell replacement and growth. This can include any cells that form our organs, hair, skin and muscles. Proteins are broken down into amino acids during digestion. Amino acids are what our body uses to build protein chains and create new cells.

Fats provide your body with energy and also aid in cell growth and repair. They are also used to create essential hormones such as estrogen, testosterone and adrenaline. Consuming enough fat will keep your cells functioning properly. Fats are broken down into smaller chains of fatty acids during digestion. These fatty acids are transported through blood to be used for energy or any other purpose they're needed for within our bodies, including synthesizing certain vitamins that are needed to support other functions.

As you can see, each macronutrient is special in its own way. This is why it's important to consume a balance of them. They also provide our body with different vitamins and minerals. If you reduce your intake of one macronutrient, then your body may also struggle to absorb and use other nutrients. This can lead to nutritional deficiencies and a multitude of problems.

On the next page, you'll find a list of incredible foods that you should consume on daily basis.

Great food choices FOR EACH MACRO

PROTEINS

- ○ Chicken Breast
- ○ Chicken thigh
- ○ Chicken drumstick
- ○ Pork medallion
- ○ Kangaroo Fillet
- ○ Beef filet
- ○ Lamb chop
- ○ Turkey breast
- ○ Veal
- ○ Beef sausage
- ○ Pork sausage
- ○ Tofu
- ○ Seitan
- ○ Tempeh
- ○ Edamame
- ○ Hempseed
- ○ Salmon
- ○ COD
- ○ Canned tuna
- ○ Shrimp
- ○ Pollock

CARBS

- ○ White rice
- ○ Brown rice
- ○ White pasta
- ○ Whole-wheat pasta
- ○ Gluten-free pasta
- ○ Couscous
- ○ Quinoa
- ○ White potatoes
- ○ Sweet potatoes
- ○ White slice of bread
- ○ Wholegrain slice
- ○ Popcorn
- ○ Apple
- ○ Orange
- ○ Grapefruit
- ○ Banana
- ○ Red grapes
- ○ Green grapes
- ○ Peach
- ○ Strawberries
- ○ Blueberries
- ○ Raspberries

HEALTHY FATS

- ○ Avocadoes
- ○ Eggs
- ○ Almonds
- ○ Hazelnuts
- ○ Brazil nuts
- ○ Peanuts
- ○ Pistachios
- ○ Cashews
- ○ Chia seeds
- ○ Olive oil
- ○ Flaxseed oil
- ○ Coconut oil
- ○ Cheddar cheese
- ○ Mozzarella
- ○ Parmesan
- ○ Feta cheese
- ○ Manchego
- ○ Brie
- ○ Roquefort
- ○ Whole milk
- ○ Semi-skimmed milk
- ○ Greek yogurt

How much food should you eat?

CALORIES

Calories are a unit of energy. They simply indicate how much food you should consume to stay healthy, gain weight or shed fat. They are calculated in three simple steps. Make sure to grab a calculator and let's see how much food you need to consume per day.

CALCULATE YOUR BMR

BMR is an acronym for Basal Metabolic Rate and it refers to the number of calories that your body requires to use to perform all the biological and physiological processes.

To calculate your BMR, follow these equations:

WOMEN

655 + (4.35 x weight in pounds) + (4.7 x height in inches) - (4.7 x age) = **BMR**

MEN

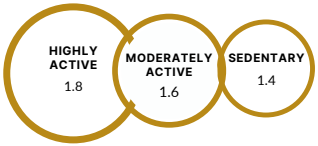

66 + (6.23 x weight in pounds) + 12.7 x height in inches) - (6.8 x age) = **BMR**

This is the number of calories that your body requires in order to survive. The next step is calculating how many calories your body requires to perform daily activities (TDEE).

CALCULATE TDEE

TDEE stands for Total Daily Energy Expenditure and it refers to a number of calories that your body needs in order to perform any daily activities (plus biological and physiological processes). This is also know as your maintenance calories, and it's how many calories you need to maintain your current weight.

To calculate your TDEE, simply multiply your BMR by an activity factor as displayed below:

CALCULATE YOUR CALORIC DEFICIT

To start shedding fat, you should deduct approximately 200-300 calories from ***STEP 2*** outcome. Avoid deducting any more as this will limit your ability to get lean and toned. Muscles help you burn more calories at rest which makes them an integral part of your weight loss journey.

Divide YOUR CALORIES BETWEEN MACRONUTRIENTS

Everything we eat will be categorised into one of the three macronutrients. Since all foods contain a mixture of all three macronutrients, they will be categorized under one since it contains the most of that macronutrient.

So, how do you divide you calories?

Once you followed the above steps to calculate your calories, you can use that total to divide between each macronutrient accordingly:

PROTEIN

Approximately 1g of protein should be consumed per 1lb of bodyweight. This means that if you weigh 140lbs, then you should consume 140g of protein. To figure out how many calories that is, simply multiply the grams by 4.

CARBOHYDRATES

Approximately 50-55% of your total daily calories should come from starchy carbohydrates. If you're going by 50%, then simply divide your total calories by 2. Then, divide the calories by 4 to get the grams.

FATS

Approximately 30-35% of your total daily calories should come from healthy fats. Once you've deducted the calories for proteins and carbs, the remaining calories should be used for fats. This should roughly be falling within the 30-35% mark.

To figure out the number of grams that is, simply multiply those calories by 9.

DOUBLE CHECK YOUR MATHS

Once you know your calories for each macronutrient, simply add them all together to make sure that they equal to your total daily calories. If not, perform the calculations again, it's likely that you went somewhere wrong.

EXERCISE
Exercise Plan
PLAN

The structure of THE WEIGHT LOSS PROGRAM

This is a gym-based weight loss exercise plan which has been built to challenge every part of your body. In this challenge, you'll participate in weight lifting exercises which tone and sculpt your body as well as high intensity workouts that shed fat.

Over the next few pages, you'll see the workout plan. The left side shows the exercise that you should perform and the right side provides sets and reps. A set is a group of consecutive repetitions and reps are the repetitions, so one complete motion of an exercise. For example, If the column states 3 x 12 crunches, you will need to do 12 crunches to complete 1 set. Then re-do the 12 repetitions for remaining 2 sets. Do 1 set and move to the next exercise, then return to the start of the workout to repeat the routine as many times as the sets specify.

FAQ

SHOULD I DO ANY ADDITIONAL CARDIO?

Whether you should do cardio or not depends on your goal and your current body composition. With that being said, if you are currently overweight or obese, you should consider doing some cardio. If you are slim or skinny you should mainly focus on building muscle to get that toned look.

WHAT KIND OF CARDIO IS BEST?

A mixture of all high intensity and low intensity cardio is the best to achieve the best results. Never focus on just one type of a workout as each type brings different benefits.

SHOULD I USE WEIGHTS FOR THIS PROGRAM?

Adding weights is a perfect way to speed up your progress and sculpt your body, let's refer to it as progressive overload. Progressive overload refers to gradually increasing weights as you become stronger. This means that your muscles will be forced to grow and strengthen themselves so they can carry out the exercise that you do! If you have dumbbells or kettlebells at home then yes, definitely.

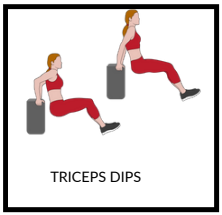

WARM UP AND STRETCH

Many people neglect warming up and stretching but it's important that you don't. Warming up and stretching improve your range of motion, lengthens your muscles and improves blood and oxygen flow - all factors associated with better recovery and greater results. On top of that, stretching and warming up helps you avoid any injuries as muscles become warm and more elastic. Here's a sample stretch and warm up routine:

Week 6

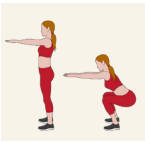

CALORIE AND EXERCISE TRACKER

MONDAY		WATER INTAKE
	Workout: ☐ 10k steps: ☐	
TUESDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
WEDNESDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
THURSDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
FRIDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
SATURDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
SUNDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	

Increase your weights by 1-2kgs / 2-4lbs.

WORKOUT PLAN

DAY 1: GLUTES AND LEGS

SQUATS

SETS X REPS
4 x 10

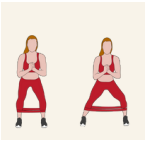

Weights:

BULGARIAN SPLIT SQUATS

SETS X REPS
4 x 10

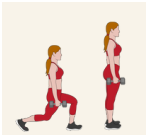

Weights:

BANDED WALKS

SETS X REPS
3 x 20

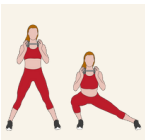

Weights:

WALKING LUNGES

SETS X REPS
3 x 12

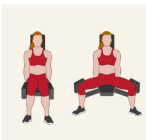

Weights:

SIDE LEG LUNGES

SETS X REPS
3 x 12

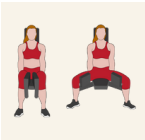

Weights:

HIP ABDUCTOR

SETS X REPS
3 x 12

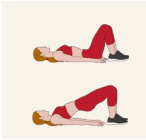

Weights:

HIP ADDUCTOR

SETS X REPS
3 x 12

Weights:

GLUTE BRIDGES

SETS X REPS
4 x 10

Weights:

Increase your weights by 1-2kgs / 2-4lbs.

WORKOUT PLAN

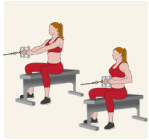

DAY 2: BACK AND BICEPS

PULL UPS

SETS X REPS
3 x 15

Weights:

SEATED ROWS

SETS X REPS
3 x 15

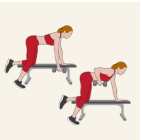

Weights:

BENT OVER ROWS

SETS X REPS
4 x 10

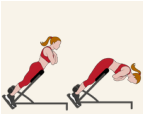

Weights:

SINGLE ARM ROW

SETS X REPS
4 x 10

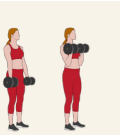

Weights:

BACK EXTENSIONS

SETS X REPS
3 x 12

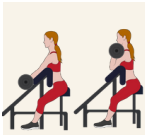

Weights:

BICEP CURLS

SETS X REPS
3 x 12

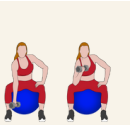

Weights:

PREACHER CURLS

SETS X REPS
3 x 12

Weights:

CONCENTRATION CURLS

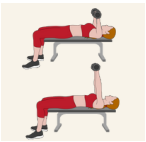

SETS X REPS
3 x 12

Weights:

Increase your weights by 1-2kgs / 2-4lbs.

WORKOUT PLAN

DAY 3: CHEST AND TRICEPS

WG CHEST PRESS

SETS X REPS
3 x 12

Weights:

NG CHEST PRESS

SETS X REPS
4 x 10

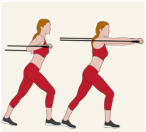

Weights:

CHEST FLIES

SETS X REPS
4 x 10

Weights:

CABLE CHEST PRESS

SETS X REPS
4 x 10

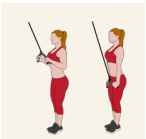

Weights:

OVERHEAD EXTENSIONS

SETS X REPS
3 x 12

Weights:

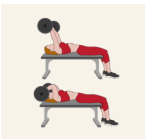

TRICEPS PULLDOWN

SETS X REPS

3 x 12

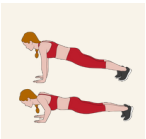

Weights:

SKULL CRUSHERS

SETS X REPS
3 x 12

Weights:

PUSH UPS

SETS X REPS

1 x until failure

Increase your weights by 1-2kgs / 2-4lbs.

WORKOUT PLAN

DAY 4

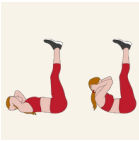

CRUNCHES

SETS X REPS
1 x 25
Weights:

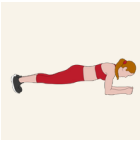

V-UPS

SETS X REPS
1 x 20
Weights:

RAISED LEGS CRUNCHES

SETS X REPS
1 x 20
Weights:

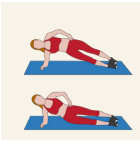

PLANK

SETS X REPS
1 x 45 secs
Weights:

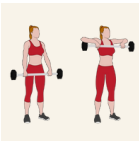

SIDE PLANK

SETS X REPS
1 x 45 secs
Weights:

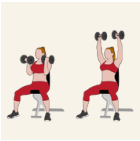

SIDE PLANK RAISES

SETS X REPS
1 x 15 (each side)
Weights:

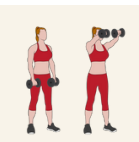

UPRIGHT ROW

SETS X REPS
3 x 12
Weights:

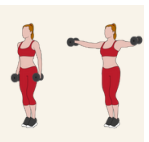

ARNOLD PRESS

SETS X REPS
3 x 12
Weights:

FRONT RAISES

SETS X REPS
3 x 12
Weights:

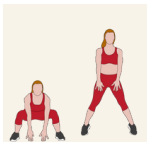

LATERAL RAISES

SETS X REPS
3 x 12
Weights:

Repeat workout 2-5 times based on your current fitness level.

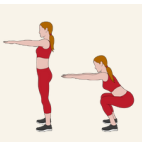

WORKOUT PLAN

DAY 5: HIIT WORKOUT (NO REST BETWEEN EXERCISES)

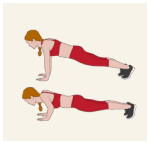

FROG JUMPS

SETS X REPS
1 x 30
Weights:

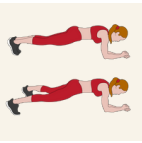

SQUAT JUMPS

SETS X REPS
1 x 16
Weights:

PUSH UPS

SETS X REPS
1 x 15
Weights:

PLANK JACKS

SETS X REPS
1 x 8
Weights:

BICYCLE CRUNCHES

SETS X REPS
1 x 30 secs
Weights:

BURPEES

SETS X REPS
1 x 10

Week 7

CALORIE AND EXERCISE TRACKER

MONDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

TUESDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

WEDNESDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

THURSDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

FRIDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

SATURDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

SUNDAY	WATER INTAKE
Workout: ☐ 10k steps: ☐	

Week 8

CALORIE AND EXERCISE TRACKER

MONDAY		WATER INTAKE
	Workout: ☐ 10k steps: ☐	
TUESDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
WEDNESDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
THURSDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
FRIDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
SATURDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	
SUNDAY		**WATER INTAKE**
	Workout: ☐ 10k steps: ☐	

REST &
Rest & Recovery
RECOVERY

Why is...

RESTING SO IMPORTANT FOR WEIGHT LOSS?

The stress of losing weight means your body is under a lot of physical strain. If you don't give it time to recover, then you're setting yourself up for burnout, which can result in lack of motivation, lowered willpower and an inability to stick with your diet or workout routine. Here are some of the best rest and recovery techniques.

NUTRITIONAL RECOVERY TIPS

HYDRATION

Exercising involves a significant amount of water loss, which can contribute to dehydration. This can lead to changes in blood volume, organ function, and muscle contraction may occur. As a result, it's critical to replenish water after exercise to allow muscles and organs to heal and prepare for the next workout.

CARBOHYDRATES

Exercise tears muscle in order to strengthen and rebuild them bigger. When muscle damage occurs, your body may struggle to replenish the energy storage, and this is important for better muscle contraction. So, you need to consume enough carbohydrates (discussed in the previous chapter).

PROTEINS

Proteins are vital for muscle growth and recovery, without adequate intake of protein, your progress will be greatly affected.

PHYSICAL RECOVERY TIPS

STRETCH

Flexibility is important as it allows for a whole range of motion of the muscle and joints, but also keeps muscles more pliable and prevents injury. It can also improve circulation and encourages muscle relaxation. Incorporate a stretching routine during a warm-up or a cool down to help blood flow through the muscles to help them relax and recover.

YOGA

Stretch your muscles and expand your range of motion using yoga poses. They'll increase your flexibility, body functionality and relieve tension with consistent practice. Check out some of the most commonly used poses like the tree pose, warrior pose, horse and oat pose.

MASSAGE THERAPY

Massage therapy Increases range of motion so you can perform the exercise with a better form regulates skin and muscle temperature, improves blood flow, and relieves cramps and muscle soreness. Make sure the massage is of deep tissue nature.

SLEEP

Sleep is vital for post-exercise recovery, and it has shown to significantly improve recovery and athletic performance. Sleep quality increases physical performance, reaction times, overall mood, and fatigue. Some of the most well-known bodybuilders will take regular naps before and after workouts to help them recover before their next workout.

There is a lot of research that indicates the benefits of sleep on athletic performance and recovery, and they all point to the same conclusion: you need to sleep to fully recover.

A word of advice: if you want to get a good night's sleep, make sure you have a good mattress. There's nothing like waking up rejuvenated and free of back pain!

THANK YOU
